

Non-Functional testing

Group 4

Non-functional testing evaluates the quality attributes of a software system that are not directly tied to its functional requirements. These attributes include:

- **Performance**
- **Reliability**
- **Scalability**
- **Usability**
- **Maintainability**
- **Security**

Objectives include improving usability, efficiency, maintainability, portability, reducing risks, streamlining setup and execution, and collecting performance metrics.

Types of Non-Functional Testing

- **Load**
- **Performance Testing**
- **Security Testing**
- **Compatibility Testing**
- **Reliability and Availability Testing**

Load testing:

we used Locust for our load testing.

1. **tested Categories , filters(price range, new , ending soon) in the Admin dashbord part**

3: Admin dashboard

4:Payment getaway before bidding for a specific auction that was posted

Compatibility Testing:

Compatibility Testing is a software testing process designed to confirm that an application or system functions correctly across diverse environments, including different hardware, operating systems, browsers, networks, and devices. Its primary objective is to ensure the software is compatible with external factors it may encounter in real-world scenarios. This testing helps uncover issues such as rendering problems, performance discrepancies, or feature failures caused by differences in configurations or platforms. By addressing these concerns, compatibility testing enhances user experience and ensures the application is accessible to a wider audience.
